Sine Wave Profile is the new VM ZINC® cladding system using sinusoidal profiles on a wood or metal secondary framework.

Based on a traditional cladding method, Sine Wave Profile is a new addition to the VM ZINC® offer. It is ideally suited to the flat surfaces of new service industry buildings and collective housing or for their renovation.

The undulations of Sine Wave Profile add vitality and a sense of lightness to facades giving the building a very distinctive appearance.

Sine Wave Profile is available in pre-weathered QUARTZ-ZINC® and ANTHRA-ZINC®, can be laid horizontally or vertically and offers 3 depths and shapes of waves.

Competitive and original, Sine Wave Profile meets the requirements of:

- **Architects**, thanks to its unique aesthetics.
Coupled with the nobility of zinc, Sine Wave Profile enhances all types of architecture by allowing full expression of the liberty and modernity of architectural shapes. The architect can play with the effects of light and shade. Thanks to the different depths and number of waves he can create a multitude of combinations: playing with the length of the waves, horizontal and vertical installation, the variety of surface aspects, the possibility of combining with other cladding materials or zinc cladding systems.
- **Contractors and facade installers:** thanks to its lightness, it's easy installation and traditional implementation requiring no transforming.
The Sine Wave Profile system includes a full range of accessories for corners, junctions, lintels and cladding bases.

VM ZINC® Sine Wave Profile is the result of dynamic, high-tech research into the building envelope. It provides an aesthetic, durable material that requires no maintenance. Like VM ZINC® it is synonymous with quality, durability and reliability.

VM ZINC® is the international brand of rolled zinc products made and marketed by the Building Products Unit of the Belgian Umicore Group, leader in non ferrous metals.

The VM ZINC® range is divided into five product families: Roofing – Finishing elements for roofs - Facade - Rainwater evacuation systems - Ornaments.

The uncontested leader in France, Belgium and most European markets, the Building Products Unit has a strong international development policy.

In France, the products are marketed through a specialist distribution network. As the industrial partner of specifiers and roofers VM ZINC has developed an active service policy: design assistance, training for roofers through the PRO-ZINC department, machine rentals, technical assistance, etc.
